

Group 53: Project Step 3

<http://Flip3.ENGR.OregonState.edu:1991> (Tested in Google Chrome)

Members: Mason Blanford, Whitney Zilton

Executive Summary

This database app archives research publications and its citations and academic authors. To fit the scope of a quarter semester, some constraints, like a foreign authors_id key for Institutions, were omitted.

Some feedback asked about many-to-many relationships, which we limited to Citations and Research_Papers_has_Authors. Citations used to be one-to-many. We removed author_id and citation_id from Research_Papers, as they weren't needed to capture the many-to-many nature. Junction table operations don't cascade to parent tables because there's nothing to cascade — only the junction tables manage the many-to-many relationships.

On the data relationships, there can be many research papers with citations and vice-versa, but there don't necessarily have to be any citations for a research paper in the database. Therefore, the relationship would be many (optional)-to-many (mandatory), Research_Papers to Citations, respectively, because a Citations entry can't exist without a citation.

One concern was transitive dependencies. Some feedback said the country and address constraints in Institutions could cause data anomalies. However, our schema wasn't threatened by anomalies with geography, and again, scope has to be considered in a quarter semester. We're not entirely sure it could cause an anomaly to begin with and think the terms' logical associations were mistaken for dependencies.

Several smaller changes were made:

- Tables Research_Papers and Research_Papers_has_Authors had duplicate constraint names, causing issues with SQL queries.
- Some text wasn't geared for laymen, so we improved that while building the website. However, we chose to keep the doi constraint — Digital Object Identifier, a code used to find academic papers in many other databases — for brevity.
- Our outline and SQL code had different character restraints for the same constraints — e.g., inputting countries in Institutions had a 100-character restraint that we shortened to 20.
- Our SQL file needed more work to make it cleanly importable; we rewrote it by hand, since earlier steps allowed imported SQL.
- Some who tested our initial site found edge cases we hadn't considered, like adding attributes not NULL but simply empty strings. We've prevented that with "required" HTML tags.

Project Outline

This application indexes research papers and their academic citations. The relational database could, with expansion, streamline direct access to source data for verification.

Published papers have risen exponentially since the 1940s, from some 200,000 to three million in 2000. Before 2020, there were over seven million. Self-citation isn't always unethical, but a paper's average amount of self-citations has also risen — 0.3 in 1950 and 2.2 by 2020. Poor citation, not just self-citing, can spread academic myths. With direct access to literature and its citations, misinformation is less likely to occur.

In this database, a Citations entity visualizes a research paper's citations and vice-versa, with the papers in a Research_Papers entity. An Authors entity archives authorial information, while Institutions stores similar data on publishing organizations. Disciplines logs the papers by subject.

The project's scope is constrained to enough research papers and authors to show appropriate data relationships. We can assume each research paper cites one other research paper. Not every paper is necessarily cited.

Database Outline

Research_Papers — Academic research publications

- Constraints
 - research_paper_id: int, auto_increment, not NULL (Primary Key)
 - title: varchar(100), not NULL
 - date_published: date, not NULL
 - doi: varchar(100)
 - doi means Digital Object Identifier, a common code to find publications.
 - institution_id: int (Foreign Key)
 - discipline_id: int, not NULL (Foreign Key)
- Relationships
 - many-to-many (Research_Papers to Citations)
 - Publications can have many citations, and citations can involve many research papers.
 - many-to-many (Research_Papers to Authors)
 - Publications can have many authors, and researchers can write many papers.
 - one (optional)-to-many (Research_Papers to Institutions)
 - Publications can have one publishing organization but don't need one, since some researchers are independent. An institution can back many research papers.
 - one (mandatory)-to-many (Research_Papers to Disciplines)
 - A publication must belong to an academic field, but that field can have many publications.

Citations – Which publications cite or are cited by other research papers

- Constraints
 - citation_id: int, auto_increment, not NULL (Primary Key)
 - citing_paper_id: int, not NULL (Foreign Key)
 - cited_paper_id: int, not NULL (Foreign Key)
- Relationships
 - many-to-many (Citations to Research_Papers)
 - Citations can have many research papers and vice-versa.

Authors – Who has written what

- Constraints
 - author_id: int, auto_increment, not NULL (Primary Key)
 - first_name: varchar(20), not NULL
 - last_name: varchar(20), not NULL
- Relationships (Authors to Research_Papers)
 - many-to-many (Authors to Research_Papers)
 - Researchers can write many papers; publications can have many authors.

Research_Papers_has_Authors – Links several authors to research papers, if needed

- Constraints
 - research_paper_author_id: int, auto-increment, not NULL
 - paper_id: int, not NULL (Foreign Key)
 - name_id: int, not NULL (Foreign Key)
- Relationships
 - many-to-one (Research_Papers_has_Authors to Research_Papers)
 - Can log one research paper many times.
 - many-to-one (Research_Papers_has_Authors to Authors)
 - Can log one author many times.

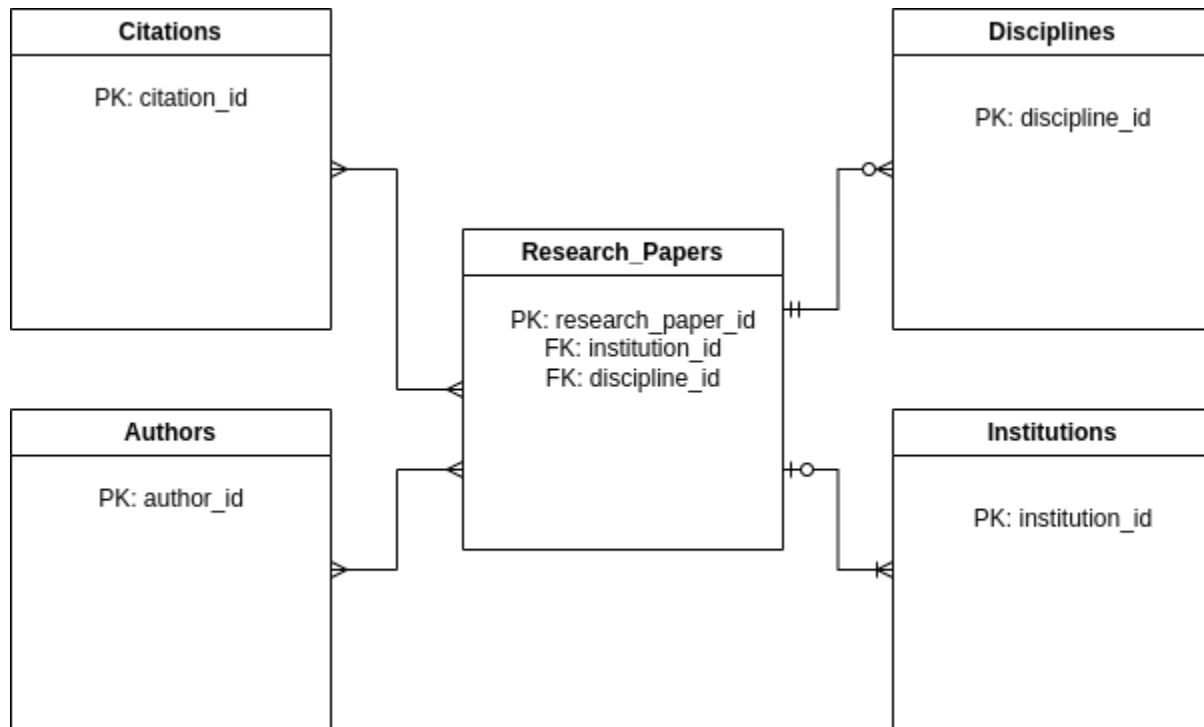

Institutions – Publishing organizations

- Constraints
 - institution_id: int, auto_increment, not NULL (Primary Key)
 - name: varchar(50), not NULL
 - address: varchar(50), not NULL
 - country: varchar(100), not NULL
 - website: varchar(100), not NULL
- Relationships:
 - many-to-one (optional) (Institutions to Research_Papers)
 - Organizations can publish many research papers, but publications can exist without an institution.

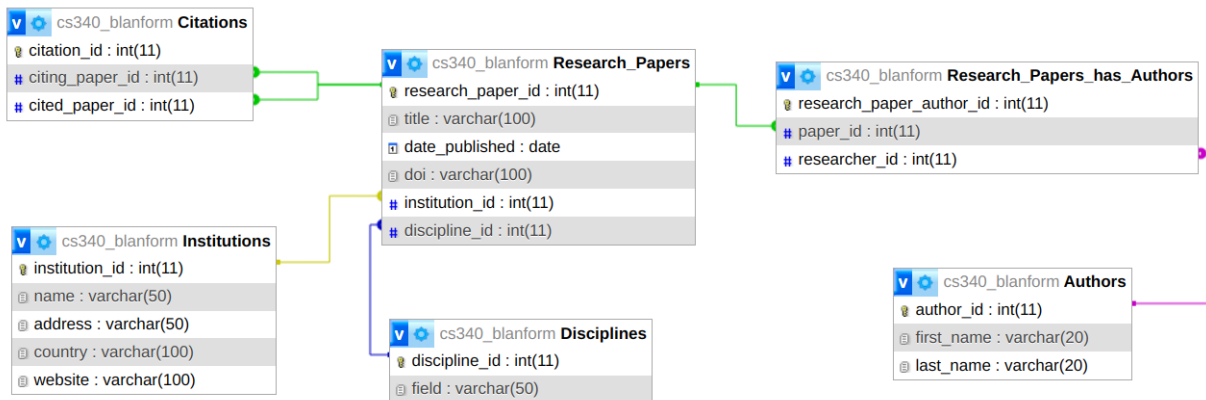

Disciplines – Research fields

- Constraints:
 - discipline_id: int, auto_increment, not NULL (Primary Key)
 - field: varchar(50), not NULL
- Relationships:
 - many-to-one (mandatory) (Disciplines to Research_Papers)
 - Research fields have many publications, and every research paper belongs to a discipline.
